

Project Design Phase

Proposed Solution

Date	7 September 2026
Team ID	Individual
Project Name	An employee requests installation of licensed software through the Service Catalog
Maximum Marks	2 Marks

Proposed Solution :

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Employees need a simple and standardized way to request installation of licensed software. Manual coordination through emails or separate communication can make approval and fulfillment difficult to track and may cause delays.
2	Idea / Solution description	Create a ServiceNow Service Catalog item for licensed software installation. The employee enters Software Name, Version Required, License Justification, and Urgency. The request is stored as REQ/RITM, routed through an automated approval workflow, and after approval a Catalog Task (SCTASK) is created and assigned to the Software Support Team for fulfillment.
3	Novelty / Uniqueness	The solution combines a standardized software request form with automated approval and fulfillment in one ServiceNow process. Required information is captured at submission, approval is routed automatically, and the fulfillment task is generated without separate manual coordination.
4	Social Impact / Customer Satisfaction	Employees get a clear and user-friendly process for requesting required software, with better visibility of request progress. The IT team receives structured requests with the necessary information, reducing unnecessary follow-up and improving service delivery.
5	Business Model (Revenue Model)	This is an internal IT service-management solution rather than a commercial product. It supports organizational efficiency and cost control by reducing manual administrative effort, improving software request handling, and supporting licensed-software governance.
6	Scalability of the Solution	The solution can be extended to additional software, departments, approval groups, and request conditions. ServiceNow workflows, Business Rules, Service Catalog items, and Update Sets allow the configuration to be reused and migrated across instances as the organization grows.
