

Project Design Phase

Solution Architecture

Date	8 September 2026
Team ID	Individual
Project Name	An employee requests installation of licensed software through the Service Catalog
Maximum Marks	4 Marks

Solution Architecture:

The solution architecture for the Software Installation Request Automation project bridges the employee's software-request problem with a ServiceNow-based technology solution.

Its goals are to:

- Provide a standardized Service Catalog process for requesting licensed software.
- Define how request data moves through ServiceNow from submission to approval and fulfillment.
- Automate approval and fulfillment activities using the configured workflow / Flow Designer and Business Rules.
- Provide a clear architecture that can be managed, tested, migrated, and delivered using ServiceNow Update Sets.

Project-specific architecture:

An employee submits the Software Installation Request catalog item with Software Name, Version Required, License Justification, and Urgency. ServiceNow creates the related REQ and RITM records. The configured automation routes the request for manager or authorized approval. If approved, a Catalog Task (SCTASK) is created and assigned to the Software Support Team for fulfillment. Business Rules support backend logic such as assignment and status handling, while notifications can communicate important request stages. Update Sets package the configuration for controlled migration between ServiceNow instances.

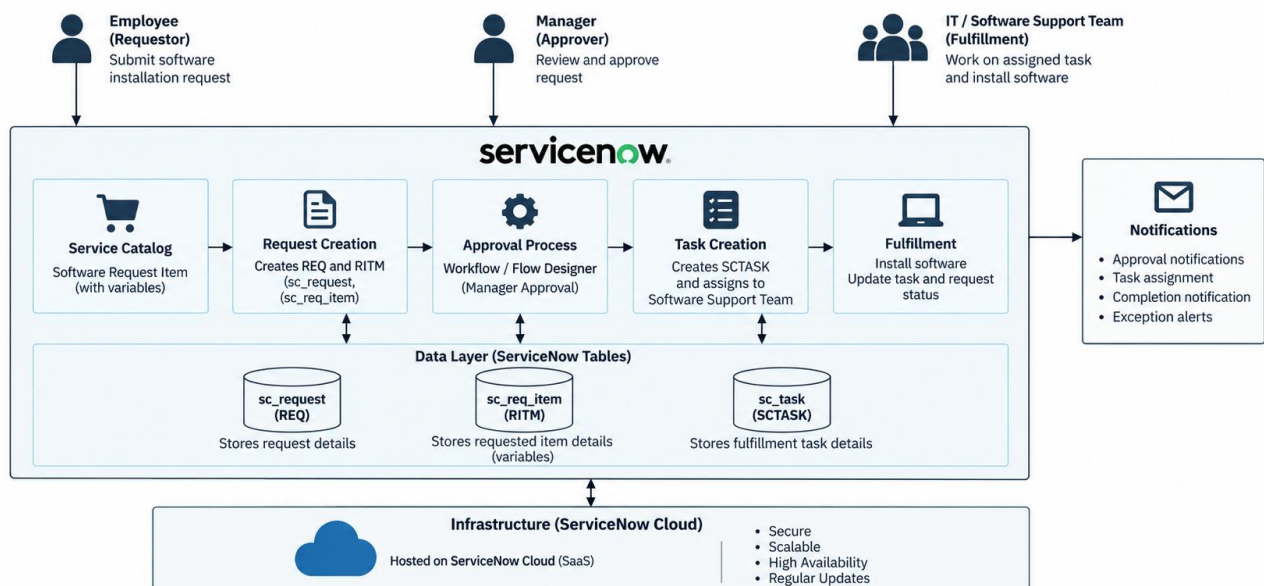

Figure 1: Solution architecture and data flow of the ServiceNow Software Installation Request Automation

Architecture Components:

Component	Purpose
Employee / Requestor	Initiates the licensed software installation request.
Service Catalog	Provides the standardized Software Installation Request item and captures required variables.
ServiceNow Data Layer	Stores request information through sc_request (REQ) and sc_req_item (RITM).
Approval	Manager or authorized approver reviews and approves/rejects the request.
Workflow / Flow Designer	Controls the automated request, approval, and fulfillment sequence.
Business Rules	Support backend automation such as task assignment, status updates, and related logic.
Catalog Task (SCTASK)	Represents the fulfillment work assigned to the Software Support Team.
Notifications	Communicate relevant request, approval, and completion status.
Update Sets	Package and migrate configured ServiceNow changes between instances.
